Abstract

Dataset: 20,000 individual financial records covering monthly income, spending categories, savings, debt, insurance, and emergency fund data.

Suggestion : All suggestion from SEBI , Fintech company India, and NPS guidelines — India-specific and reliable.

Scope: Five critical problem areas across four age groups (18–64) — each with real-life scenarios, data evidence, and four actionable solutions.

Outcome: Over 80% of individuals fall in the Risky category. Reducing expense ratio by 10% can improve 5-year savings by up to 40–50%.

Problem Statement

Low Savings Despite Adequate Income Many individuals earn well but see most of their income absorbed by recurring expenses, leaving only a small fraction for savings. This highlights the need to track and control essential vs. non-essential spending.

Inefficient Expense Allocation The dataset shows disproportionate spending on non-essential categories compared to basic needs. Optimizing these allocations can free up resources without compromising necessities.

Poor Budget Management High discretionary spending ratios reveal weak financial discipline. Overspending patterns suggest the absence of structured budgeting and prioritization of long-term goal

Low Disposable Income After covering fixed and variable costs, individuals often have limited flexibility. Debt obligations and lifestyle inflation further reduce disposable income, weakening financial resilience.

Proposed Solution

The Personal Financial Planning Forecasting Model (PFPFM)

analyses 20,000 financial records across 4 stages:

(1) Data Input — income, expenses, savings, debt, emergency funds, insurance across 5 age groups (18–64).

Age 18–25: Build Financial Habits

Start micro-savings with auto-transfers.

Use budgeting apps to track discretionary spending.

Focus on essentials to avoid lifestyle inflation.

Age 26–35: Growth & Stability

Establish emergency funds and begin investments.

Cut non-essential subscriptions and optimize expenses.

Adopt structured monthly budgets for career/family needs.

Age 46–55: Retirement Preparation

Redirect discretionary spending toward retirement savings.

Reduce debt obligations to increase disposable income.

Set fixed savings targets tied to income

Age 56–64: Financial Flexibility

Prioritize wealth preservation over growth.

Optimize healthcare and insurance costs.

Downsize or adjust lifestyle to free resources.

All Age Groups (18–64): Universal Strategies

Conduct regular expense audits to identify overspending.

Balance essentials, discretionary, and savings allocations.

System Architecture

Data Input / Source

20,000 individual records: income, expenses, savings, EMI, investments, emergency funds. Five age groups: 18–25, 26–35, 36–45, 46–55, 56–64. Benchmarks from SEBI, RBI, FPSB India, IRDAI, NPS/PFRDA.

Processing / Analysis

Duplicate removal, missing value handling. Normalization (0–1 scale). Ratio engineering: Savings Ratio, Expense Ratio, Debt Ratio. Weighted FHS model. 5-year forecasting and scenario analysis

AI / Tool Integration

Excel: Pivot tables + advanced formulas. Power BI + Copilot: DAX measures, NL queries, automated insights. scenario narratives, insight generation, report automation.

Output / Dashboard

. Risk Flag Alerts. Priority Action Cards. Consolidated Age-Group Action Plan

Live Demo of Project

Demo 1

we first analyze a high-income individual earning ₹1,00,000+, but due to a high debt-to-income ratio, low savings, and only 1.5 months of emergency funds, they fall into a financially vulnerable category.

Demo 2

Income vs Spending dataset:
Correlation: 0.98 → Almost entire income is spent
High spending observed in:
 Discretionary expenses (*Eating Out, Entertainment*)
Expense Ratio: 65–85% (*Very high*)

Demo 3

Microsoft Copilot reduced manual reporting time from hours to minutes. AI generated structured recommendations, validated formulas, and produced stakeholder-ready summaries from financial data.

You can embed a video your live project.]*

Conclusion

The analysis of 20,000 individual financial records highlights a critical reality: while Indian households demonstrate a healthy intent to save, there are significant structural gaps in how savings are allocated and protected.

Over 80% of individuals score in the Risky category — primarily due to high expense ratios (0.65–0.85), insufficient emergency reserves, underinsurance, and absence of structured retirement instruments.

Key insight: Reducing expense ratio by just 10% can improve 5-year savings by up to 40–50%. Younger individuals who invest in NPS/ELSS during prime compounding years (18–25) gain a generational financial advantage. All objectives achieved: data cleaning (20,000 records), FHS weighted scoring model, 5-year forecasting, Power BI dashboard, and full AI integration with Copilot

Future Scope

Phase 2 — Real-Time API Integration:

Integrate APIs for real-time market rates, CPI inflation, and interest rate updates.

Fintech REST API:

Build a scalable REST API with push risk alerts for banks, NBFCs, and fintech platforms; scale to 100K+ users.

Advanced ML Models:

Replace fixed weights with dynamic, ML-based scoring; add behavioral ML for spending pattern detection and personalized nudges.

Mobile App with AI Coaching:

Launch a mobile application with Copilot for real-time, personalized financial coaching and goal tracking.

Expanded Dataset:

Extend to 1M+ records across geographies for regional financial insights and diverse demographic analysis.
